Ex.No-5

Data Cleaning & Preparation (Excel file)

Aim

To do the Data Cleaning and Preparation using Excel data.

Description:

Read the Excel file, do the data cleaning process and write the updated data set into excel file

- 1. Remove the white space using str.strip function
- 2. Fill the forward values for NaN using fillna(pad) method
- 3. Drop one particular column using drop function
- 4. Drop NaN rows using dropna function
- 5. Replace the values(s) using replace function
- 6. Extract the particular record based on the isin() function condition

PROGRAM:

```
import pandas as pd
pd.set_option('display.max_columns', 10)
print("Original data set from Excel file:\n")
df=pd.read_excel("d:\sample1.xlsx")
print(df)
f=df['NAME'].str.strip()
f.to_excel("D:\sample22.xlsx")
print("\nReplace value with Forward:\n")
k=df.fillna(method='pad')
print(k)
print("\nThe above updated data set will be stored in sample2.xlsx file....\n")
k.to_excel("d:\sample2.xlsx")
print("\nDrop one particular column and its values:\n")
k.drop(['TOTAL'],axis=1, inplace=True)
print(k)
print("\nThe above updated data set will be stored in sample3.xlsx file....\n")
```

```
k.to_excel("d:\sample3.xlsx")
print("\nDrop NaN rows:\n")
df=pd.read_excel("d:\sample4.xlsx")
print(df)
x=df.dropna()
print(x)
print("\nThe above updated data set will be stored in sample5.xlsx file....\n")
x.to_excel("d:\sample5.xlsx")
print("\nReplace values:\n")
n=pd.read_excel("d:\sample3.xlsx")
print("Original data set:\n");
print(n)
y=n.replace({49:50})
print("\nUpdated dataset with replaced values: {49:50}\n")
print(y)
print("\nThe above updated data set will be stored in sample6.xlsx file....\n")
y.to_excel("d:\sample6.xlsx")
print("Original data set from Excel file:\n")
df=pd.read_excel("d:\sample1.xlsx")
print(df)
print("\nExtract the particular record based on the isin() function condition:\n")
new=df['ENGLISH'].isin([49])
print(df[new])
```

OUTPUT:

Original data set from Excel file:
